

OptoDrum

Innovations in optomotor tracking

Measuring vision in freely moving animals

- ▶ **Ophthalmology:** characterization of vision
- ▶ **Toxicology:** screening for vision defects
- ▶ **Pharmacology:** efficacy and safety testing
- ▶ **Phenotyping:** new genetic lines
- ▶ **Disease models:** track disease progression

/// As a previous user of a system with 'manual' analysis I cannot tell you how happy I am to have the OptoDrum. The fact that it is easy to use and it relies on an unbiased method to determine 'yes' or 'no' decisions for mouse behavior helps a lot in designing and conducting experiments.

Dr. Abdoulaye Sene, Genentech

/// The OptoDrum is a valuable addition to our non-invasive testing equipment. It is a convenient, reliable, and sensitive read-out that gives us unbiased and comparable results for longitudinal analysis of neuroinflammation-related damage in the retinotectal system of mice.

Dr. Janos Groh, University Würzburg

/// We are not necessarily faster than an experienced user who has many years of experience with such tests, but the results are finally objective. Until now, it was difficult or even impossible to compare data collected by different users.

Prof. Volker Enzmann, University Bern, Switzerland

/// The OptoDrum has a user friendly and sturdy design. It is incredibly easy to use and delivers results right away. On top of this, Striatech provides great support!

Prof. Marius Ader, TU Dresden

Developed with support from:

/// **Striatech**

/// Advantages

► Fully automated

Automated animal detection
Automated behavior analysis
Automated adjustment of stimulus pattern
Fast, objective, bias-free results

► Easy setup

Use it right out of the box
No training of animal required
Front door allows easy handling of animal – and easy cleaning

► For mice and rats

Larger version for rats available

/// How it works

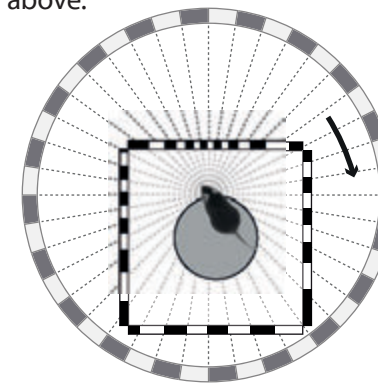

1 The animal sits on an elevated platform, surrounded by computer monitors.

2 The stripe pattern slowly rotates around the animal, triggering the optomotor reflex.

3 A camera observes the animal's behavior from above.

4 The head movement is automatically detected and analyzed by the OptoDrum software.

5 The projected pattern is continuously and automatically adjusted.
